

ABSTRACT

It is an object of the invention to provide a light
5 emitting device which can display a superior image in
which luminescent color from each light emitting layer is
beautifully displayed and power consumption is lowered in
a light emitting element in which light emitting layers
are stacked. One feature of the invention is that, in a
10 light emitting element which comprises light emitting
layers stacked between electrodes, each distance between
each light emitting layer and an electrode is odd
multiples of quarter wavelength with a range of plus or
minus 10% thereof by controlling a thickness of a layer
15 provided therebetween to enhance luminous output
efficiency. Another feature of the invention is that a
drive voltage is lowered using a high conductive material
for the layer compared with a conventional element.
